

The Mercury StoreCard™

Using a 2D Bar Code Reader

Mobile payments made easy! With the Mercury StoreCard™, you can offer mobile payments to your customers with no hassle. Cardholders can convert their plastic StoreCard into a mobile card on the StoreCard Manager website, and then pay using their smartphone.

To make mobile payments faster and easier, we recommend adding a 2D bar code scanner to your POS system to allow for easy scanning at the register.

The scanner will pull the 19-digit card number data from the QR Code® on the smartphone into your gift card number field on your POS. Most POS systems have a USB port available, and most scanners can easily connect to the POS system using a USB port.

Many kinds of barcode scanners will work with your POS and successfully scan a mobile card from a smartphone. Whichever barcode scanner you choose, it must be able to scan 2D barcodes.

We have successfully tested the following scanners:

- Gryphon™GD 4400 2D hand scanner
- Honeywell™ Voyager 1400g (2D)
- Honeywell™ Xenon 1900 (2D)
