

A Dental Implant is a cylindrical and/or tapered post, usually made of titanium, that serves as a substitute for the tooth root.

An abutment is a connector that is placed on, or built into, the top of the dental implant, to connect the implant to the replacement tooth or teeth.

A Crown is a replacement tooth, custom made to match your natural teeth.

Dental implants are often the best treatment for missing teeth. When a damaged or decayed tooth is removed, both the visible part of the tooth, called the crown, and the root are lost.

Dental implants are the closest you can get to healthy, natural teeth. They will allow you to confidently eat, smile, laugh, talk, play and enjoy all of your regular activities of everyday life without thinking about your teeth.
