

Brow Lift

Also known as a forehead lift, a brow lift minimizes the creases that develop across the forehead, or those that occur high on the bridge of the nose; improves what are commonly referred to as frown lines; and repositions a low or sagging brow. It can also be considered as an extension of correction for aging changes of the upper eyelid, to correct the lateral sagging of the brow that occurs with age, and this is actually its most common indication. The central brow ordinarily does not sag much with age, but there are normally considerable aging changes in the lateral brow, which appear as excessive skin in the lateral portion of the upper eyelid. The brow lift is usually approached through a limited incision approach, with small incisions in the temple region (within the hairline), and in some cases in the central scalp region as well.

Enhancing Your Appearance

Enhancing your appearance with a brow lift

If you are bothered by expression lines or other signs of aging in the brow region, a brow lift may be right for you. Often the aging changes are seen as excessive skin the lateral upper eyelid region (lateral hooding) and crow's feet area.

A Brow Lift:

- Repositions a low or sagging brow that is hooding the upper eyelid
- Improves what are commonly referred to as frown lines, vertical creases that develop between the eyebrows
- Raises the eyebrows to a more alert and youthful position
- Minimizes the creases that develop across the forehead, or those that occur high on the bridge of the nose, between the eyes
- The procedure can be tailored to accomplish one or all of these goals.
- Rejuvenation procedures typically performed in conjunction with a brow lift include:
 - Eyelid surgery to rejuvenate aging eyes
 - Facelift to correct aging changes in the mid- to lower face and neck regions
 - Skin resurfacing techniques
- A brow lift is a highly individualized procedure and you should do it for yourself, not to fulfill someone else's desires or to try to fit any sort of ideal image.
